Web Development for NLP – Part II

The aim of the course is to continue exploring web application development at an intermediate level. This part of the course will be heavily focused on JavaScript as the main programming language of the web. The topics will include DOM manipulation in vanilla JS, external API consumption, or usage of ASR (Automatic Speech Recognition) and Speech Synthesis to build spoken chatbots. Students will work in groups and prepare web applications, which will be hosted on GitHub pages. The course presupposes familiarity with the topics covered in Part I of the course, i.e. HTML, CSS, and basic JavaScript.
